

What is claimed is:

1. A copper clad laminate coated with copper foils of different thicknesses on both sides, wherein a first copper foil on one side of said laminate is not recrystallizable by hot pressing for production of said laminate and a second foil on the other side is recrystallizable by the hot pressing and thicker than said first foil.

2. A copper clad laminate coated with copper foils of different thicknesses on both sides, with a first copper foil on one side of said laminate and a second foil on the other side, wherein said second copper foil is more recrystallizable by hot pressing and thicker than said first foil.

3. A copper clad laminate coated with copper foils of different thicknesses on both sides, with a first copper foil on one side of said laminate and a second foil on the other side, wherein said second copper foil contracts more under heating for hot pressing and is thicker than said first foil.

4. A copper clad laminate coated with copper foils of different thicknesses on both sides, with a first copper foil on one side of said laminate and a second foil on the other side, wherein said second copper foil has a lower Young's modulus and is thicker than said first foil.
